

## Pixels and Step Size on the TI-85: A Technical Exercise

By Gary A. Harris

g.harris@ttu.edu

Recall that to graph a function on the TI-85 you choose **GRAPH** from the keyboard, the **y(x)=** from the bar menu and define your function,

say  $y1=x^2$ .

Next **EXIT** this menu and chose **RANGE** from the bar menu and enter your range for the values of x and y, and the scale for each axis.

Say  $xMin=-3.15$ ,  $xMax=3.15$ ,  $xScl=1$ ,  $yMin=-3.15^2$ ,  $yMax=3.15^2$ , and  $yScl=1$ .

Finally choose **GRAPH** from the bar menu and set back and let the machine do its thing. The point of this exercise is to explore just how the TI-85 goes about drawing that nice little picture on its screen.

The TI-85 selects sample values for x between xMin and xMax inclusively, approximates via some mysterious “numerical process” the corresponding values of y(x), just  $x^2$  in this case, and “plots the point (x,y(x))” by lighting a little spot, called a pixel, above the sample x value on the x-axis and across from a spot on the y-axis that it thinks is pretty close to representing the corresponding value for y(x). Then it connects the consecutive spots by “straight lines” in the **DrawLine FORMT** or just leaves them as they are in the **DrawDot FORMT**.

The method for approximating y(x) most surely depends on how we define the function y(x), but the way the machine chooses the sample values for x is always the same. It chooses them *uniformly distributed*, one for each pixel from xMin to xMax; that is to say, consecutive sample values are all the same distant apart. If we knew the number of sample points, pixels, on the x-axis then we could determine just how far apart they must be.

*Ex 1.* Suppose there were 11 sample points, all the same distance apart from  $xMin=0$  to  $xMax =10$ , inclusive. How far apart must they be?\_\_\_\_\_

*Ex 2.* Suppose there were 100 sample points from -25 to 25, how far apart must they be?\_\_\_\_\_

Ex 3. Suppose we know that all the sample points are .5 units apart on the range  $x_{\text{Min}}=0$  to  $x_{\text{Max}}=20$ . How many sample points are there including both  $x_{\text{Min}}$  and  $x_{\text{Max}}$ ?\_\_\_\_\_

Ex 4. Experiment with **TRACE** from the GRAPH bar menu using the above function and range to determine the number of sample points (pixels) on the x-axis of your machine. Including  $x_{\text{Min}}$  and  $x_{\text{Max}}$  there are \_\_\_\_\_ equally spaced sample points on the x-axis.(It's cheating to look in your manual.)

Ex 5. If we want to sample at every integer value for x, with 0 exactly in the center, we must choose  $x_{\text{Min}}=_____$  and  $x_{\text{Max}}=_____$  (Check out the range after using **ZINT** from the **ZOOM** menu.)

Ex 6. Can you guess the effect on the value of  $x_{\text{Min}}$  and  $x_{\text{Max}}$  from using **ZDECM** from the **ZOOM** menu?\_\_\_\_\_ Explain?\_\_\_\_\_

---

Ex 7. If  $x_{\text{Min}}=0$  what is the largest value possible we can choose for  $x_{\text{Max}}$  so that both  $x=6$  and  $x=9$  are sample points?\_\_\_\_\_ Use **TRACE** to verify that 6 & 9 are sample points. Explain why this is the biggest value for  $x_{\text{Max}}$  that works.\_\_\_\_\_

---

Ex 8. If  $x_{\text{Min}}=0$  what is the largest value possible we can choose for  $x_{\text{Max}}$  so that both  $x=5$  and  $x=9$  are sample points?\_\_\_\_\_

Ex 9. If  $x_{\text{Min}}=0$  what is the largest value possible we can choose for  $x_{\text{Max}}$  so that both of two positive integers  $x=n$  and  $x=m$  are sample points? \_\_\_\_\_ (Of course the answer is in terms of some integer related to the integers n and m.)

Ex 10. Counting  $x_{\text{Min}}$  and  $x_{\text{Max}}$  there are an odd number of pixels on the x-axis of the TI-85. Explain why this guarantees that the center of the range of x values is always a sample point. (Recall that the center of the interval from  $x_{\text{Min}}$  to  $x_{\text{Max}}$  is given by the formula  $(x_{\text{Min}} + x_{\text{Max}})/2$  and the length of the interval is  $x_{\text{Max}} - x_{\text{Min}}$ .)\_\_\_\_\_
